                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Submitted (10-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA ON MAY 10, 2003 this sequence version replaced gi:25188698.

The sequence in this sequence version replaced gi:25188698.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Mithin each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs stated beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature

On May 11, 1999 this sequence version replaced gi:4678553.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projectsf/ elegans/wormpep This sequence is the entire insert of clone RP5-106901 The true left end of clone RP4-738116 is at 92256 in this sequence. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one Mis subclone; and the assembly was confirmed by restriction digest. This sequence was generated from part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 Mapping Group. Further information can be found at http://www.snager.ac.uk/HGP/Chr20

RP5-106901 is from the library RPC1-5 constructed by the group of Pieter de Jong. Por further details see http://www.snager.ac.uk/HGP/Chr20
HSJ106901 92357 bp DNA linear PRI 04-APR-2001 Human DNA sequence from clone RPS-106901 on chromosome 20. Contains part of the gene for a novel protein similar to a low density AL049633
                                                                                                                                                                                                                                               Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

order and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least RX average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel nucleic acid representing a synthetic Bax gene. The Bax gene of the invention is useful for identifying Bax-resistant yeast or fund; identifying, or obtaining and identifying candida spp. sequences that are differentially expressed in a pathway eventually leading to programmed cell death. The products of the invention have cytostatic, fundicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The invention have cytostatic, fundicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The invention have cytostatic, fundicide; pharmaceutical compositions, antisense molecies and antibodies are useful as medicament for reacting, preventing and/or alleviating diseases associated with yeast or fungi or proliferative disorders, such as cancer, or for preventing apoptosis in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preparing a medicament for modifying the endogenic flora of humans and preparing a medicament for modifying the endogenic flora of humans and cher mammals. The vaccine is useful for immunising against yeast or fungal infections. Apoptosis-related diseases include autoimmune disease, ischaemia, diseases related with viral infections or neurodegenerations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1)

In the specification). ABN15762 to ABN27252 encode the human ORFX

proteins given in ABP00010 to ABP11500. ORFX proteins are useful for

treating or preventing a pathology associated with an ORFX-associated

disorder in humans, and in the manufacture of a medicament for treating a

cyndrome associated with ORFX-associated disorder. ORFX polymucleoride

squances can be used in gene therapy. ORFX sequences can be used in the

treatment of cancer, hyperproliferative disorders, cirrhosis of liver,

psoriatists, benign tumours, keloid, degenerative disorders related to organ

transplantation, cardiovascular diseases, diabetes mellitus, systemic

lupus srythematosus, hypertension, hypothyroidism, cholesterol ester

storage disease, various immune deficiencies and disorders, infacettous

diseases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host

disease and autoimmune inflammatory eye disease. ORFX proteins are also

This invention describes a novel nucleic acid representing a synthetic.

Bax gene. The Bax gene of the invention is useful for identifying and identifying candida spp. sequences that are differentially expressed in a pathway eventually leading to programmed cell death or identifying inhibitors or inhibitor sequences of Bax-induced cell death. The products of the invention have cytostatic, fungicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The invention have cytostatic, fungicide; pharmaceutical compositions, antisense molecules and antibodies are useful as medicaments or in preparing a medicament for treating, preventing and/or alleviating a scancer, or for preventing applyers in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preventing applyers, in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preventing apportosis in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preventing and infections and infections Apoptosis-related diseases include autoimmune disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ischaemia, diseases related with viral infections or neurodegenerations. This sequence represents a polynucleotide associated with the Bax gene described in the disclosure of the invention.
                                                                                                                               New isolated nucleic acid representing a synthetic Bax gene, useful as medicament for treating, preventing and/or alleviating yeast or fungal infections or proliferative disorders, or for preventing apoptosis in certain diseases

634 694 Yeast, protein-protein interaction, Selected Interacting Domain; SID (RTM); secretion yield, cancer, neurodegenerative disease, fungicide; cytostatic, neuroprotective, gene, ds. 954 601 661 9 The present invention relates to complexes between Saccharomyces cerevisiae Selected Interacting Domain (SID (RTM)) proteins and coding sequences. The protein complexes of S. cerevisiae are useful in drug development, in screening drugs or agents that modulate the interaction of proteins, for developing yeast strains with better secretion yield of protein, and in gene therapy. The protein complexes, polypeptides and polynucleotides are useful for preventing or treating Candida infection, cancer or neurodegenerative diseases in humans or animals. The present sequence is a coding sequence of the invention. New protein-protein complexes of Saccharomyces cerevisiae, useful in drug screening or development, for developing yeast strains with better secretion yield of protein, or in gene therapy (e.g. to treat Candida 602 AACAATTAGGGGCAGATTATGTTTTTCGATTATGGAGACGCTGATGTTGTCAATAAAATTA 575 ATATCAATGCTTATACTAAGATTGTAACTGTTGCTTCTAAAAAGCATGAAAAGCTTTTAA 545 TAGTGTA---TAATCTCAAAGTAATCACCACAGCATCACCCAAAAACCACACACCTTGA 635 AGTCTTATGGTGCTGATGATGTCTTTGACTATCATGATGCAGGCGTTATTGAGCAGATCA 895 CAAGAAATTCTATTGGGTGCAACAAGATTTCCTGCTAGTCCAGAATATCATGAAGCCACA 1 cargaagraccarrregaaacarracrrraccagccgacrcagaagcraggaaagcrgca Yeast selected interacting domain coding sequence SEQ ID NO: 15. ö 5.8%; Score 64.4; DB 24; Length 1330; llarity 56.0%; Pred. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access the S. aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human disease, including cellulitis, eyelid infections, food poisoning, osteomyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of furgs to treat or prevent P. falciparum prince in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of for plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite biology, a process hampered for vaccine and drug development. Parasite resistance to drugs and mosquito resistance of insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB181352 represent nucleotide and protein sequences given in the present invention, but which are not

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TGGACCAAATGCTAGTACTGACTTGAAGGTTGGAGATACCGGTTTCGGTTTTGTTCACGG 275
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acid probes for measuring gene expression in a sample derived the probes with a collection of detectably labelled nucleic acids derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the coxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TGAAGGTGACAAAGCTGTTGTTAAAACAGATGTCTCAGTTCCAGAATTAAAGGAGGGTAC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human floetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     325 recegaregrearegregatearearegregatecrecrearegregatecearec

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, disgnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        326
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            96 AGCCTTGGTGAAGGTTGAGGCTGTTGCTGGTAACCCAACTGATTGGAAGCATATTGCTTA 155

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single exon nucleic acid probes for analyzing gene expression in human

                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                         Probe #12651 for gene expression analysis in human cervical cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present invention relates to human single exon nucleic acid probes

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast third properties of development, inflammatory diseases non-carcinoma tumours.
                                                                                                   215
                                                                  266

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                205 TCCTGCTGATGGTTTTGATGGTTATGATGATGGTGATGCTGACGGTGATGATGGTGA 146
                          specification for complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipporteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS31005 represent human liver single exon nucleic acid probes of the invention.

Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TGAAGGTGACAAAGCTGTTGATAAAACAGATGTCTCAGTTCCAGAATTAAAGGAGGGTAC

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acide derived from human lung comprising (a) contacting the array with a collection of detectably labeled nucleic acide derived from human lung the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detectably specific hybridisation of detectably labeled nucleic acide from eukaryote; lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; sasigning exons from genomic sequence by the method above mentioned in the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays should be assigned to a single exon pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single exon pattern of expression nallysis, and for the strong in agency particularly expression nallysis, and for identifying exons in a gene, appetite comprising one of 12011 sequences, mentioned in the specification, or encoded by the expression nallysis, and for identifying exons in a gene, pattern of expression analysis, and contact, chondis symment of indentifying exons in a gene, pattern by interstitial lung disease (ILD), familial identify the expression pa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystit pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a single exon
                                                                                                                                                                                                                                               Spatially-addressable set of single exon nucleic acid probes, used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              probe open reading frame of the invention.

The present invention relates to novel screening methods for identifying therapeutic agents for diseases associated with protein misfolding. The method involves contacting a yeast cell with a candidate compound, where the yeast cell expresses a polypeptide comprising a misfolded disease protein, contacting the yeast cell with a toxicity inducing agent and protein, contacting the yeast cell with a toxicity inducing agent and candidate compound is a candidate therapeutic agent. The method is useful to screen for therapeutic agents for diseases associated with protein misfolding such as Alzhaimer's diseases (AD), Parkinson's disease (PD), Familial amyloid polyneuropathy, tauopathies (e.g. Pick disease) contactington's diseases, spinocerebellar ataxia (SCA), fragile-X syndrome, myotonic dystrophy, dentacorubral pallidoluysian atrophy (DRPLA) and prion diseases (e.g. Creutzfeldt-Jacob disease (CD)), fatal familia
                                                                                                                                                                                                                                                                                                                  Human; protein misfolding; Alzheimer's disease; AD; Parkinson's disease; PD; Familial amyloid polyneuropathy; tauopathy; frontotemporal dementia; Pick disease; lobar atrophy; trinucleotide disease; fragile-X syndrome; Huntington's disease; spinocerebellar ataxia; SCA; myotonic dystrophy; Gentatorubral pallidoluysian atrophy; DRPLA; Creutzfeldt-Jacob disease; CUD; prion disease; Gestmann-Straussler-Scheinker disease; SSS, FEI; fatal familia insomnia; mad cow disease; scrapie; kuru; anticonvulant; nootropic; neuroprotective; cerebroprotective; htQl03 protein; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Screening for therapeutic agents for protein misfolding disease, by contacting a yeast cell with compound, that expresses misfolded disease protein, and with a toxicity inducing agent, and evaluating cell for

insomnia (FPI), Gerstmann-Straussler-Scheinker disease (GSS), mad cow disease, scrapie and kuru). The method is useful for treating a patient with Huntington's disease or Parkinson's disease. The present sequence is a DNA encoding human huntington. (htQ103) protein. This sequence is used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                             comprising a polynucleotide encoding a protein operably linked with a heterologous promoter sequence. The invention also concerns methods for providing gene therapy for genetic deficiency disorders. Vectors of the invention are useful for delivering a polynucleotide encoding a protein to a vertebrate cell preferably a mammalian cell, such as a human cell. The vector is introduced into the vertebrate cell by infection in a viral particle, or by transfection, transduction, or injection either in viron or in vivo. The vector is useful for the delivery and expression of biologically useful proteins in gene therapy protocols, and for delivering large DNA segments for empineering of vertebrate cells. Polynucleotides of the invention have applications in techniques such as their use as insertion sites for foreign genes of interest, hybridisation probes, for chromosome and gene mapping, in PCR technologies, and in the production of sense or antisense nucleic acids, Vectors of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 948
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              provide for stable integration and expression of heterologous DNA in host cells, and are adapted for accepting large heterologous polynucleotide inserts which can be delivered in an infected or transformed cell and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    559 TATTATGAAAAATTTATTATAAAAAACCATTTTCTATGTATAGCAAATATCATGAA 618

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

polynucleotide encoding protein to vertebrate cell, comprises polynucleotide encoding protein operably linked with heterologous

entomopox

recombinant

Novel

promoter sequence

virus vector useful for delivering

                                                             anino acid sequences given in AMM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased example, they may be used to treat disorders associated with decreased that affect the activity of (I) by expression in a patient's genome that affect the activity of (I) by expression in a patient's genome that affect the activity of (I) by expression in active proteins or to supplement the patients own production of (I). Additionally, (I) columnications and polymucleotides may be used to protein of the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polymucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoletic antigen genomic to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. The invention relates to a recombinant entomopox virus (BPV) vector, comprising a polynucleotide encoding a protein operably linked with a heteracologus promoter sequence. The invention also concerns methods for providing gene therapy for genetic deficiency disorders. Vectors of the invention are useful for delivering a polynucleotide encoding a protein to a vertebrate cell preferably a mammalian cell, such as a human cell. The vector is introduced into the vertebrate cell by infection in a viral particle, or by transfection, transduction, or injection either in viron or in vivo. The vector is useful for the delivery and expression of biologically useful proteins in gene therapy proteocls, and for delivering large DNA segments for engineering of vertebrate cells. Polynucleotides of the invention have applications in techniques such as their use as insertion sites for foreign genes of interest, hybridisation production of sense or antisense mucleic acide. Vectors of the invention provide for stable integration and expression of heterologous DNA in host cells, and are adapted for accepting large heterologous polynucleotide construction and expression of the transformed cell and expressed in a stable fraction. The current sequence represents a moorei fragment of the genome of the genus B entomopoxvirus from ameacts moorei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ATGAATATTAAAGTTTTCAGCAACGGCTTAGATGATGTCCCAGCTCTCACTGAAGGTATA 1068
